

李汶道(DennySORA)

Senior. Cloud Engineer

New Taipei City, Taiwan

Backend and infrastructure specialist with expertise in Kubernetes, cloud services, and microservice development.

Proficient in Go and Python with demonstrated success in optimizing cloud costs and performance.

Email: dennysora.main@gmail.com

Programming Language

- Golang (Gin)
- Python (Asyncio, FastAPI, Flask)
- Rust (Basics)

DevOps

- GitHub Actions
- GitLab-CI
- Infrastructure as Code

Frontend & Backend

- Vue.js (Nuxt 3)
- Tailwind CSS
- RESTful API

Databases

- PostgreSQL
- Redis

Cloud & Infrastructure

- AWS 、 Azure
- Terraform 、 Terragrunt
- Kubernetes 、 Helm

Observability

- Opentelemetry
- Prometheus
- Grafana 、 Loki 、 Tempo

Professional Experience

工作經歷

Senior. Cloud Engineer

趨勢科技 TrendMicro • 七月 2022 - Present

Companion-Orchestrator Agent Center

- Designed and shipped an agent-orchestration platform on Google **ADK** with clear app architecture and module boundaries.
- Implemented **Agent-to-Agent (A2A)** communication to coordinate remote agents.
- Built an **LLM agent** with tool use, state tracking, retries, and error handling.
- Delivered a web **Playground** for scenario testing and prompt/tool debugging; frontend developed independently with AI-assisted workflows.
- Created a **CopilotKit** adapter and composed multi-step **LangGraph** flows.
- Enabled **dynamic agent loading** via database-backed configs for zero-downtime rollout.
- Authored **ADK ↔ AGUI Middleware** (Python 3.13+) providing SSE streaming and Human-in-the-Loop workflows; integrated with the orchestrator.
- Achieved an end-to-end pipeline **A2A → ADK → LangGraph → CopilotKit** adopted cross-org with the other team.
- Link:** ADK-AGUI Middleware (GitHub): <https://github.com/trendmicro/adk-agui-middleware>

Platform Development & API Management

- Built a plugin-based **API platform** that lets teams ship integrations without core changes; provided lifecycle hooks, auth, and rate limiting.

- Developed a **Collector Manager** for configurable log routing with backpressure and retry controls.
- Created a **Mini-Companion** system with GitHub-based sync for declarative workflows.
- Implemented a **Companion Proxy** enforcing PII redaction and policy-based request filtering.

Cloud Infrastructure Optimization

- Re-architected **EKS** node groups: moved monitoring to **ARM** nodes for cost savings and introduced dedicated **CPU-/memory-optimized** pools.
- Resolved Kubernetes compatibility defects in **Stream Lake** environments.
- Authored **modular Helm charts** to standardize deployments across services.
- Fixed **CNI IP** exhaustion and routing issues to stabilize multi-tenant clusters.

AI Integration & Data Security

- Built an **AWS Comprehend PII** pipeline that reduced costs by **~99%** while preserving detection quality.
- Created an **AI Proxy Adapter** with **Amazon Bedrock** integration and policy enforcement.
- Developed a **Kafka → Neptune** pipeline for MITRE-aligned knowledge graphs.
- Implemented fine-grained **AI access controls** with auditability and tenant isolation.

Technical Leadership

- Produced executive-level AI demos for the CEO's **NVIDIA** presentation.
- Led internal workshops on AI tooling and best practices.
- Recognized as **Employee of the Quarter**.
- Drove cross-functional enablement through reusable platform components.

Back-End Engineer

KKStream • 六月 2021 - 七月 2022

DevOps & Infrastructure

- Optimized GitLab CI/CD pipelines, reducing deployment time by 40%
- Deployed Kubernetes clusters using Helm
- Implemented Terraform for infrastructure as code
- Managed Kubernetes clusters using Kops

System Architecture & Development

- Designed Kafka-based consumer service architecture
- Created Docker Compose development environment
- Integrated multiple backend services and databases
- Built low-latency streaming server using Golang

Research & Implementation

- Evaluated WebRTC Mesh and SFU technologies
- Integrated Pydantic for robust data validation
- Refactored monolithic projects for better maintenance
- Implemented CI/CD pipeline testing integration

(Intern) Back-End Engineer

天堂遊戲有限公司 • 一月 2019 - 七月 2019

API Development & Optimization

- Optimized RESTful APIs using Golang PProf
- Reduced API response times by 30%
- Refactored codebases for improved modularity

Research & Evaluation

- Implemented Apache Spark for data processing
- Demonstrated GraphQL API capabilities
- Evaluated emerging technologies for adoption

Side Project

DLsite Auto Classification System

- Created async Python app for content classification
- Implemented web scraping for metadata extraction
- Built RESTful APIs for content management
- Developed file deduplication system
- **GitHub:** <https://github.com/dennySORA/DLsite-Classification>

Tech Note
